Digital Literacy

Name : Krissh Raj Rana

Reg No : 25BEC10001

Slot : B23

Task 1: Digital Literacy Awareness Infographic

Starting off with Canva made sense - simple controls, plenty of built-in designs. Templates helped speed things up, also lots of visual bits to choose from. What counts as digital literacy? That question opens the section near the top. Followed by reasons it matters today, laid out plainly below. Online safety comes next, then tools learners actually use. Email basics appear toward the end, explained step by step. Icons pop between lines of type, breaking up words with shapes. Together, visuals and sentences aim for clarity. Classmates should follow without slowing down.

What surprised me most during the project was how shapes, tones, and spacing could turn tangled ideas into something clear. It took many attempts to shape the look right. After that came the task of squeezing everything neatly onto a single sheet without making it feel crowded. Working through those limits pushed me to think differently about showing complex thoughts simply.

Task 2 : Digital Portfolio

Starting off with GitHub, I set up or refreshed my profile there - code sharing happens mostly through that space. Moving over to LinkedIn, the spot where work connections grow, mine now reflects updates too. On Kaggle, known more for data challenges than chat, my account got attention as well. A personal intro lives in my GitHub README these days; it holds details like my full name, study path, and what I aim to achieve academically. That wraps what changed across those platforms lately.

Four years ahead look shaped by where I share work, grow contacts, learn fast. Projects find a home on GitHub - visible proof of what I can do. Connections form on LinkedIn, guided by those already working in tech fields; openings appear there too. Practice meets challenge at Kaggle, sharpening how I tackle data puzzles. Growth comes less from plans, more from showing up.

Starting out, figuring out profile layout felt tricky. Yet working through it showed why an online footprint matters for jobs later on. Though confusing at first, putting things together taught me what stands behind smart visibility.

Task 3 : Coding & Collaboration Platforms

This time around, CodeChef became my go-to spot for writing code while team updates flowed through Google Forms. A simple challenge on that platform got things moving - working it through clarified how small steps lead to solutions. That first clear win made the whole effort feel worth it. Starting there shaped the way forward.

To handle teamwork, a Google Form popped up - five questions about digital skills, mixing pick-one answers with brief written ones. Designing a basic quiz became clearer through this step. Responses poured into Google Sheets, showing where data lives after submission. Learning how results stack up there made the process click. Handling real input taught more than theory ever could.

Starting off wasn’t easy - figuring out how to shape solid quiz questions took time. Still, working through it built real know-how, hands-on and behind-the-scenes alike. Down the road, school tasks might feel smoother, especially when writing code or picking tech for group work, homework, even gathering responses.

Task 4 : Professional Email & Etiquette Guide

One time, a student wrote their professor with no subject at all. The message began abruptly - just “Send me the notes” - no hello, nothing else. Without even a name tagged on the end, it looked careless. Imagine opening that after grading ten essays late into the night. A bit of wording could have softened things, yet none was used. That tiny note might’ve been meant fast, but landed wrong. What felt like urgency came off as demand instead. Some silence followed - likely because clarity vanished along with courtesy. An inbox full of such blurbs? Easy to skip one like this. Misreading intent happens often when messages lack shape or respect. Missing parts speak loudly sometimes.

Wrong moves with emails might never happen if basics were followed - like picking a sharp subject line, speaking properly to instructors, finishing thoughts fully, staying courteous throughout. Tossing in bits like which class it is or why you’re reaching out helps others get it faster. What stuck after this round: saying things right matters when dealing with serious situations.

Task 5 : Cybercrime Awareness Case Study & Prevention

Surprisingly, digging into cybercrime revealed how fast someone might get caught in scams - phishing, UPI fraud - even when they think they're careful. Fake links pop up where you least expect them; a rush of panic from a message does the rest. Turns out, knowing what to watch for matters just as much as understanding security tools.

Now I think twice before opening links or replying to messages online. Because of this, checking where a message comes from feels normal now. Sharing details like passwords or bank info waits until I'm sure it's safe. Doing this exercise highlighted dangers I used to ignore. Slowly, small habits are shifting how I act each day online.
